PROFESSIONAL SUMMARY

Senior product manager with close to 10 years in digital products. I own the vision, strategy and roadmap of **Inteligência Comercial (Nexfar)**, a **B2B SaaS subscription suite** for commercial operations, with real-time catalog, price and stock, digital quoting and AI recommendation, today serving **more than 400 users** with an **NPS above 80**. I define, instrument and communicate **product KPIs and business impact** in Power BI, Mixpanel and Clarity, and I use that data to prioritise the roadmap. I run **continuous discovery** with customers, field sales reps and non-digital areas of the business, write the specs, and hand off to engineering and QA in agile cycles. I apply **generative AI and LLMs** to product work, from data analysis to prototyping, and I brought the same logic into the product itself through OCR and recommendation modules. My background in **product design and UX research** widens what I can solve on my own: I draw the flow, validate the experience and instrument the metrics when the product calls for it.

KEY COMPETENCIES

- **Product strategy and vision:** vision, strategy and roadmap aligned to business growth goals.
- **Continuous discovery:** research with users, customers and non-digital areas (sales, CS, operations).
- **Data, KPIs and business impact:** instrumenting and reading product metrics in Power BI, Mixpanel and Clarity; data-informed prioritisation.
- **Agile lifecycle management:** roadmap, backlog, PRDs and tech specs, handoff to engineering, delivery with a focus on quality.
- **Stakeholder management:** structured communication and negotiation with technical, commercial and executive stakeholders.
- **Executive communication:** presenting to C-level and the board, building decks and written narrative, business cases with numbers and follow-through.
- **Platform access and configuration:** profiles and permissions, multi-tenant separation, provisioning of new operations and per-customer configuration.
- **Strategic decision-making:** scope trade-offs and prioritisation, build versus buy evaluation.
- **Generative AI and LLMs:** advanced use of Claude Code and AI tooling applied to product management; conception of AI and OCR based features.
- **E-commerce and sales platforms:** work on B2B e-commerce and on products sharing the Sales platform structure.
- **Product design (background):** UX/UI, prototyping, design systems and UX research.

PROFESSIONAL EXPERIENCE

Product Manager, Inteligência Comercial

Nexfar (techfin/healthtech for the pharmaceutical market), 2025 - Present

I am responsible for **nf-ic (Inteligência Comercial)**, a **B2B SaaS subscription product** that supports field commercial operations for pharmaceutical distributors, with real-time catalog, price and stock, digital quoting and AI recommendation. Live with real customers (NavarroMed, Grupo MTF).

- I defined the vision, strategy and roadmap of the suite, from zero to live operation. Three modules are in production today: *Cotação Ágil*, which captures the customer's shopping list from a photo and turns it into a quote via **OCR**, removing more than an hour of typing per quote, at 50 to 100 items on average; *Catálogo Digital*, with real-time price and stock, replacing the printed catalog; and *Objetivos e Sugestões*, an **AI module** that reads point-of-sale history and generates product mix suggestions and sales targets.
- I scaled the product from zero to **more than 400 users**, migrating **5 new operations in 6 months** with a sustained **NPS above 80**.
- *Cotação Ágil* is the main driver of adoption: **more than 400 quotes answered per month**, with **conversion above 80%**.
- In *Catálogo Digital*, **more than 300 catalogs created and shared** with the customer base in 90 days, which widened portfolio distribution and gave visibility into what customers are interested in.
- The AI suggestion module sustains an average of **around 200 orders per day** originated by the sales force, turning point-of-sale history into actionable recommendations on mix and targets.

- I defined and instrumented product KPIs in **Power BI, Mixpanel and Clarity**: weekly adoption per rep, engagement per module, quote conversion and churn risk signals. That analytical base guides roadmap prioritisation and flags distributors at risk of underuse before cancellation.
- I keep a high delivery cadence, with **more than 20 improvements shipped in the last 3 months**, prioritised from usage data and customer discovery.
- I run continuous discovery with customers, field sales and non-digital areas of the business (sales, CS). I write PRDs and tech specs, prioritise the backlog in agile cycles and hand off to engineering, working alongside Tech and QA.
- I defined the product's access rules: rep profiles, per-distributor permissions, and who sees which customer and which price. Separation between distributors (multi-tenant) and the provisioning of each new operation run through those decisions.
- I am the product point of contact with the customer: support, discovery sessions and scope negotiation with commercial stakeholders. I moved those conversations from intuition to hypotheses grounded in usage data.
- I present results, roadmap and investment proposals to C-level and the board, with decks and written narrative. I build the business case with numbers and check afterwards whether it held: that is how I identified and contained a rising analytics tooling cost before it hit the budget.
- I work the activation funnel of the installed base: I follow the rep's onboarding through to real first use, where they get stuck and what has to change for them to become a recurring user. Inside the product I treat the journey to the order as a funnel with measured steps, which is what sustains the **conversion above 80%** on quoting.
- I work on the shared Sales platform, including Nexfar's **e-commerce**, where I touched the purchase funnel and conversion. I keep a continuous interface with it, since Inteligência Comercial uses the same platform structure.
- I apply generative AI and LLMs (Claude Code) to the product process and build with them rather than only consuming them: I coded **working prototypes** to validate ideas before handoff to engineering, I put together queries and analyses I would not write on my own, and I developed **internal tooling the team uses daily**.
- I set an adoption target for each launch and track whether it was met, adjusting the plan afterwards. I prepare internal teams to sell and support what shipped, with a commercial changelog and supporting material for Sales and CS.
- I structured the product team's processes: a changelog in two formats (technical and commercial), handover routines between Product and Tech, including **AI skills I built to automate those handovers**, and documentation practices. The result was more predictable delivery and clearer communication with stakeholders.
- I treat internal efficiency as a product: I **automated with AI a routine another area was doing by hand**, and I track the team's operational indicators, from cost and delivery predictability to rework and QA rejection, alongside the support SLA with CS.
- I lead the **integration of the product with the distributors' ERP**, and I work on consolidating **multiple sales channels** arriving at the same place: field sales and e-commerce over the same base of catalog, price and stock.
- I have contact with the platform's financial layer, even though it is not the scope I lead: payment method and terms in the order flow, and the credit and receivables advance that Nexfar offers pharmacies. I know the financial routine of a **small business** from discovery, because the pharmacy buying from the distributor is the end customer of the chain.
- I test and spread AI and automation tooling across the team, a practice peers point to as a consistent gain in collective productivity.
- I am also responsible for the product design of Inteligência Comercial (UX/UI, prototyping and experience validation), which keeps strategy and interface coherent without depending on an external handoff.

Stack: Power BI, Mixpanel, Microsoft Clarity, GraphQL, ClickUp, Figma, Claude Code and AI/LLM tooling.

Senior Product Designer

Nexfar, Dec/2023 - 2025

First product designer at the company. I set up the design practice for digital product operations alongside a product owner and a product analyst, owning UX/UI, research and the design system on my own. Beyond feature delivery, I helped define design processes and ground product decisions in user and market insight. That path led to the move into product management.

Senior UX Researcher

Electrolux, Nov/2022 - Aug/2023

Hired to set up research for Electrolux's *digital* products, in an area until then focused on industrial products. I worked as a research consultant: I planned and ran usability tests, A/B tests and interviews, supported the product design team in building scripts, and helped leadership document design processes based on global standards aligned across country subsidiaries.

Lead Designer

Garupa Design, Jun/2021 - Nov/2022

I led a team of 9 designers, from intern to senior: validating deliverables, career development, defining project scope and presenting results to clients. I also worked as a designer on the **insurance and consortium purchase flow for Banco do Brasil**, designing the step-by-step of the purchase and working the business rules and the simulation together with the client. On the company's 10th anniversary I took part in the business plan for the following years, which included a new website, social media positioning and new internal processes for team relationships.

Senior Product Designer

Garupa Design, Jan/2021 - Jun/2021

I returned as a product designer to run multiple projects in short cycles, working across very different business realities. I was lead designer on several projects, including the Unicesumar brand, delivering solutions and running internal training on UX/UI and tooling (Jira).

Product Designer

Ahgora Sistemas, Mar/2020 - Jan/2021

I worked on the company's main product, **PontoWeb**, an HR management SaaS platform (Ahgora was acquired by TOTVS). I worked on the platform back office, where I designed **per-customer configuration**, which lets each company set its own rules without depending on development, and **user management**: creation, editing, deactivation and reset. I developed optimisations that adapted the product to remote work at the start of the pandemic, and built the feature set that enabled the company's largest customer to come on board. I was part of the design forum responsible for digital design standards across products.

Product Designer

myTapp Tecnologia (self-service draft beer beertech, with proprietary hardware and software), Nov/2018 - Feb/2020

First designer in the company's history, then a pioneer in self-service draft beer in Brazil. The product is a **smart tap with millilitre-level metering connected to venue management software**, and the value it delivers is a reduction in operational loss. I built the design processes while improving the products.

- I designed the **operator management dashboard**: consumption per tap, product and time of day, taking the measurement coming from the equipment through to the screen of whoever decides during the shift. I worked with the telemetry data and used it on screen, without owning the modelling of the indicator.
- The **operational variance alerts** and the **stock and replenishment control** were also mine, including keg level and temperature tracking.
- On the consumer side, I built the **self-service tap interface** and co-created with **Ambev** a no-assistance purchase kiosk for physical retail. The interface I designed is still in use.
- I helped found the "Product Team" alongside the product owner, with strategic work, discovery of new products and direct contact with the board on the business plan.

Junior UI/UX Designer

Dzigual Golinelli Design / MINT Lab, Nov/2017 - Nov/2018

Part of a team of 4 digital product designers. Main project: translating a complex solar system quoting spreadsheet from **Engie** (the largest private energy company) into a new system, built from scratch, with its own business rules and constant alignment between client and engineering. I also worked on projects for Cortois and Portobello.

UX Designer

Garupa Design, Sep/2016 - Nov/2017

Start of my career in digital design. I began by rebuilding Bradesco ATM interfaces and moved into UX, creating and presenting prototypes that were low fidelity visually and high fidelity in interaction. I was a tutor and speaker on an introductory UX course that brought universities and technology companies in Pelotas closer together and also worked as a recruiting pipeline. Projects for Bradesco, Itaú and Siemens.

SKILLS

Product: product discovery, roadmap and prioritisation, PRDs and tech specs, product metrics and analytics, KPIs and instrumentation, stakeholder and customer management, product-led growth, backlog management, build versus buy.

Data and AI: Power BI, Mixpanel, Microsoft Clarity, Claude Code and AI/LLM tooling applied to product management, AI and OCR based features. Self-sufficient in getting to the data: I build the cut inside the analytics tools and use an LLM to construct the query and the analysis when I need to go beyond them.

Design: UX research, UX/UI design, prototyping, design systems, design ops, handoff, wireframes and high fidelity prototypes.

Tools: Figma, Power BI, Mixpanel, Microsoft Clarity, Hotjar, ClickUp, Jira, Miro, GraphQL (reading and validation).

EDUCATION AND LANGUAGES

Bachelor's in Digital Design (incomplete), Universidade Federal de Pelotas (2014 - 2017)

Portuguese (native). English: B2, fluent reading and writing, intermediate conversation.

ADDITIONAL ACTIVITIES

Organiser and mentor: Semana do Design UFPel (2015), CodeArena Hackathon (2015 and 2016), Labirinto UX (2017).
